

HR Attrition Analysis

Employees Who Leave Earn Significantly Lower Average Income

Average monthly income comparison between employees who stayed and those who left

Insight:

Employees who left the organization earned an average of \$4,787 compared to \$6,833 for those who stayed. This indicates that lower compensation may be a contributing factor to higher attrition risk.

Proposed Action:

Review compensation for lower-income roles and benchmark against market rates to improve retention.

Gender Shows Minimal Difference in Attrition Patterns

Gender distribution across employees who stayed versus those who left

Insight:

The gender distribution among employees who left closely mirrors those who stayed, indicating that gender is not a significant factor influencing attrition in this organization.

Proposed Action:

Prioritize retention strategies focused on workload, compensation, and career progression, as gender does not significantly influence attrition risk.

Workforce Distribution by Department Is Relatively Similar Among Leavers and Stayers

Comparison of departmental composition between employees who stayed and those who left

The distribution of employees across departments is broadly similar between those who left and those who stayed. However, this view reflects workforce composition rather than attrition risk, which requires analysis based on attrition rates.

Attrition Rate of 16.1% Indicates Moderate Employee Turnover

Overall attrition rate across the organization

- Employees who Left
- Employees who Stayed

Moderate but actionable
level of attrition

Insight:
The organization has an attrition rate of 16.1%, indicating a moderate level of employee turnover that requires targeted retention strategies.

Proposed Action:
Establish a regular attrition monitoring dashboard to track trends and proactively identify high-risk employee segments.

Employees in their First 2 Years Have Nearly 2x Higher Attrition Risk

Attrition rate declines significantly as tenure increases

Years at Company Group

Early Tenure: 0-2 Years

Developing: 3-5 Years

13.8%

Established: 6-10 Years

12.3%

Long Tenure: 10+ Years

8.1%

Overall Attrition Rate (16%)

- Developing: 3-5 Years
- Early Tenure: 0-2 Years
- Established: 6-10 Years
- Long Tenure: 10+ Years

Insight:

Employees in their first two years experience significantly higher attrition rates, with risk declining steadily as tenure increases. This highlights early tenure as the most critical period for retention.

Proposed Action:

Strengthen onboarding, mentorship, and early-career support programs to improve retention in the first two years.

Employees Working Overtime Are 3x More Likely to Leave

Attrition rate comparison between employees with and without overtime

Insight: Employees who work overtime are significantly more likely to leave, indicating that workload and potential burnout are key drivers of attrition.

Proposed Action: Monitor overtime patterns and implement workload balancing or staffing adjustments to reduce burnout risk.

Employees with Poor Work-Life Balance Have Nearly 2x Higher Attrition

Attrition rate comparison across work-life balance levels

Insight: Employees reporting poor work-life balance experience significantly higher attrition rates, highlighting the importance of employee well-being and sustainable workloads.

Proposed Action: Introduce flexible work arrangements and improve workload planning to enhance work-life balance and reduce attrition.

Lower Income Employees Have Nearly 2x Higher Attrition Risk

Attrition rate decreases as income level increases

Monthly Income L...

Low Income

25.2%

Upper-Mid Income

15.0%

Lower-Mid Income

10.8%

High Income

5.6%

Overall Attrition Rate (16%)

Insight:

Attrition rates are highest among low-income employees and generally decrease as income increases, indicating that compensation plays a significant role in employee retention.

Proposed Action:

Review compensation structures for lower-income roles and benchmark against market rates to ensure competitiveness.

Attrition Risk Varies Significantly Across Job Roles:
Sales Representative have the Highest Attrition Risk, Followed by Laboratory Technicians and HR

Attrition rate comparison across job roles

Insight:
Attrition risk varies significantly by job role, with as Sales Representatives and Laboratory Technicians, showing the highest attrition rates, suggesting role-specific challenges in workload, engagement, or career progression.

Proposed Action:
Conduct targeted retention reviews for high-risk roles to address role-specific pain points and improve job design.

Single Employees Have ~2x Higher Attrition Risk Than Married Employees

Attrition rate comparison across marital status groups

Insight: Employees who are single have significantly higher attrition rates compared to married and divorced employees, suggesting greater mobility and lower retention.

Proposed Action: Enhance engagement initiatives and career development programs targeted at early-career and single employees.

Education Level Shows Moderate Variation in Attrition Risk

Attrition rate comparison across education levels

Insight: Attrition rates vary across education levels, with non-degree holders experiencing higher attrition (18.2%) compared to employees with a master’s degree (14.6%). While this indicates that education may have some influence on attrition, the differences are relatively modest compared to stronger drivers such as overtime, compensation, and tenure.

Proposed Action: Prioritize retention strategies focused on job conditions and employee experience, as education level alone does not strongly influence attrition risk.
